

After we've read and discussed papers over a broad range of topics in plant invasion ecology, it's your turn to select the papers and lead the discussions. Strive to choose papers that (1) integrate across the topics or disciplines we have already discussed (e.g. ecosystem processes and population biology), (2) integrate across taxonomic scales (e.g. microbial plant interactions), (3) go more into depth in one of the areas we covered in the first part of the course, or (4) cover a topic in plant invasion ecology that was neglected in the first part of the course.
