†This trial could not be interpreted due to plot variation caused by dry growing conditions and late-season hail damage. Average yields reported above are only trends and averages should not be considered different from each other. Yield results should not be used by farmers for selecting superior varieties for planting.

Site Information

Collaborator: Matt Campbell
 Harvest date: July 1, 2022
 Planting date: September 9, 2021
 Soil Type: Colby-Satanta complex
 GPS Coordinates: 39.001, -102.24629
 Trial Comments: Loose soil at planting and heavy corn stalk residue. Planted into moisture and had acceptable fall stands with some areas of spotty emergence. In mid-April trial was showing some drought stress. By early May trial had good moisture from recent rains. Hail occurred on June 24th, yield loss from damage estimated between 20-40%. Radar estimates showed the trial received 7.3" of precipitation and 3303 growing degree-days (GDD) (base 32°F) from Jan. 1st through July 1st, which was 2.7" below and 58 GDD below the 10-year average, respectively.
